DETAILED ACTION

The Sequence Listing filed 5/26/98 does not comply with the Sequence rules for the reason(s) set forth on the attached Error Report. Correction is required.

Claim Rejections - 35 USC § 112

Claims 1-4, 10, 22, 24, 26, 28 and 31 are rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the full scope of the claimed invention. There are two different facets to this rejection, one involving the scope of "birnavirus" and one involving the scope of "a substitution" which makes the virus "not able to produce a native VP5 protein". In the first case, the specification teaches one to produce the mutant virus by recombinant manipulation of the genome. In order to make the claimed viruses, one is therefore required to possess DNA clone(s) which produce full-size, infectious genomic RNA for each of the birnaviruses. The only such DNA clones set forth in the specification are clones of IBDV. Since the specification provides only a single species within the scope of the claimed birnaviruses, and it does not appear that the necessary DNAs for other birnaviruses are in the possession of applicants or of the general public, it is concluded that the specification does not adequately describe or enable the full scope of the claimed birnaviruses. In the second case, claim 2 (and dependent claims 22, 24, 26, 28, and 31) requires possession of all of the possible sequences of "a native VP5 protein" in order to possess substitution mutations which produce something other than "a native VP5 protein". Since the

Page 3

Application/Control Number: 09/084,837

Art Unit: 1643

specification and the prior art do not describe all of the variations possible in native VP5 sequences, it appears that applicant was not in possession of the full scope of substitution mutations claimed. For these reasons, the specification is seen as limited to an adequate written description of mutant IBDV, and to mutations which delete VP5 sequence, insert heterologous sequence, or substitute heterologous sequence for VP5.

Claims 1-4, 10, 22, 24, 26, and 31 are rejected under 35 U.S.C. 112, first paragraph, because the specification, while being enabling for mutant IBDV, and to mutations which delete VP5 sequence, insert heterologous sequence, or substitute heterologous sequence for VP5, does not reasonably provide enablement for the full scope of birnaviruses claimed. The specification does not enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make the invention commensurate in scope with these claims. This rejection is made for essentially the same reasons as the "written description" rejection above.

Claim 10 is rejected under 35 U.S.C. 112, first paragraph, because the specification, while being enabling for IBDV vaccines, does not reasonably provide enablement for the full scop of birnavirus vaccines. The specification does not enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the invention commensurate in scope with these claims. As discussed above, the specification adequately describes only the IBDV species of birnavirus, when describing materials which are essential to make the claimed invention. In addition, these claims involve vaccines with VP5 mutant birnavirus. Applicant has observed attenuation using VP5 mutant IBDV, but others have not correlated the absence of VP5

Application/Control Number: 09/084,837 Page 4

Art Unit: 1643

to attenuation in other birnaviruses, see for example Heppell et al. Since attenuation and vaccine efficacy are unpredictable, one skilled in the art would have reason to doubt that the observations based on IBDV would necessarily predict results in very different hosts (chickens versus fish, for example). For these reasons, enablement is seen as limited to use of IBDV.

Claims 15, 28, 29, and 31 are rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention. It is apparent that the DNA encoding the genome of IBDV strain D78 is required to practice the claimed invention, since these claims are drawn to mutants made from this strain. As a required element it must be known and readily available to the public or obtainable by a repeatable method set forth in the specification, or otherwise readily available to the public. If it is not so obtainable or available, the enablement requirements of 35 U.S.C. § 112, first paragraph, may be satisfied by a deposit. It is noted that the necessary starting materials have been described in a printed publication, but it is not clear that the necessary materials are publicly available. The specification does not provide a repeatable method for obtaining the D78 genome. Deposit of clones encoding the A and B segments of D78 would satisfy the enablement requirements of 35 U.S.C. 112.

If a deposit is made under the terms of the Budapest Treaty, then an affidavit or declaration by applicants or someone associated with the patent owner who is in a position to make such assurances, or a statement by an attorney of record over his or her signature, stating that the deposit has been made under the terms of the Budapest Treaty and that all restrictions imposed by the depositor on the availability to the public of the deposited material will be

Application/Control Number: 09/084,837

Art Unit: 1643

irrevocably removed upon the granting of a patent, would satisfy the deposit requirements. See 37 CFR 1.808.

If a deposit is not made under the terms of the Budapest Treaty, then an affidavit or declaration by applicants or someone associated with the patent owner who is in a position to make such assurances, or a statement by an attorney of record over his or her signature, stating that the deposit has been made at an acceptable depository and that the following criteria have been met:

- (a) during the pendency of this application, access to the invention will be afforded to one determined by the Commissioner to be entitled thereto;
- (b) all restrictions imposed by the depositor on the availability to the public of the deposited material will be irrevocably removed upon granting of the patent;
- (c) the deposit will be maintained for a term of at least thirty (30) years and at least five (5) years after the most recent request for the furnishing of a sample of the deposited material;
 - (d) a viability statement in accordance with the provisions of 37 CFR 1.807; and
- (e) the deposit will be replaced should it become necessary due to inviability, contamination or loss of capability to function in the manner described in the specification.

In addition the identifying information set forth in 37 CFR 1.809(d) should be added to the specification. See 37 CFR 1.803 - 37 CFR 1.809 for additional explanation of these requirements.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless --

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1, 12, 13, 16-21 are rejected under 35 U.S.C. 102(b) as being clearly anticipated by Heppell et al.

Allowable Subject Matter

Claims 5-9, 23, 25, 27, and 30 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of

Page 6

Application/Control Number: 09/084,837

Art Unit: 1643

the base claim and any intervening claims.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Mary E. Mosher, Ph.D. whose telephone number is (703) 308-2926. The examiner can normally be reached on Monday -Thursday and alternate Fridays from 6:30 AM to

4:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Marian Knode, can be reached on (703) 308-4311. The fax phone number for this Group is now (703) 308-4242.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the Group receptionist whose telephone number is (703) 308-0196.
